

MAKE READY ENGINEERING SERVICES

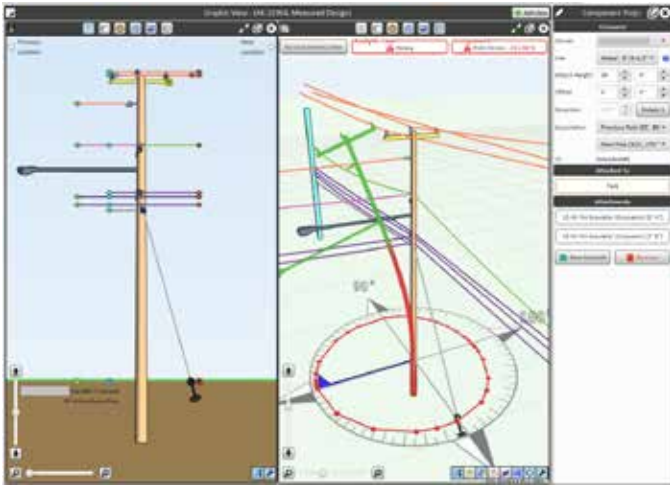

The make ready engineering process is driven by both internal and external deadline pressures. DRG recognizes the importance of meeting these deadlines but, just as critically, the importance of proactively managing every step of the process so that stakeholders are engaged and aware.

While each utility has unique needs and process, the overriding principles remain the same. They are to ensure compliance with utility standards for construction, safety requirements and federal regulations, as well as provide an efficient path for attaching customers through the make ready engineering process.

DRG recognizes each client may already have a program in place that is unique to their needs. Because of our experience working with a wide variety of utilities, our staff can seamlessly integrate with other operations, accommodating existing processes and recommending improvements.

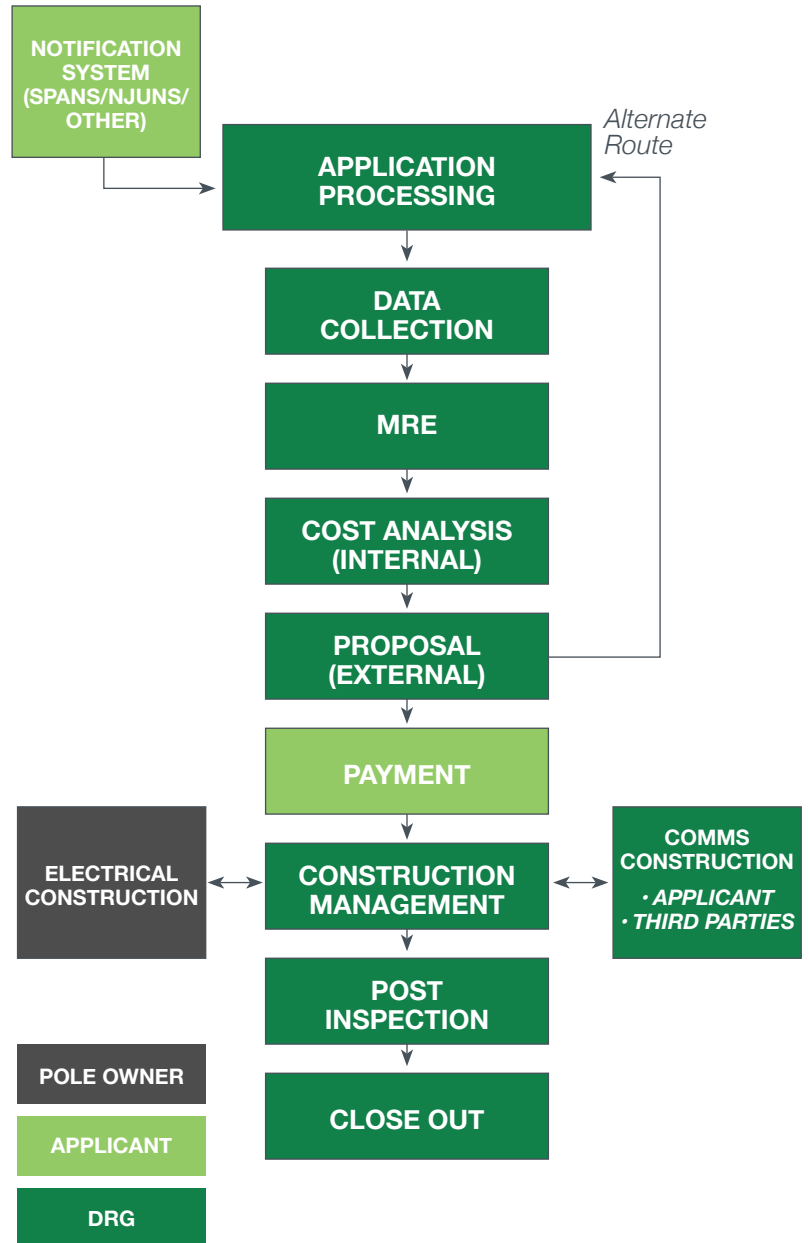

Davey works with our customers to develop the most comprehensive and efficient approach to achieving our client's data requirements and long-term project goals.

Perhaps the least measurable, a highly critical aspect of a make ready program is how it is perceived by the participants. Make ready impacts not only the utility and their applying attachers, but also other pole occupants and the utility's customers.
